

NUMERICAL VALUES OF THE INTEGRALS OF

$(2/\sqrt{\pi})\exp(-x^2)$, $(2/\sqrt{\pi})x^2\exp(-x^2)$, AND $(2/\sqrt{\pi})x^4\exp(-x^2)$

N. Owaki

Received June 15, 1960

Abstract

Tables for the numerical figures of the functions $\frac{2}{\sqrt{\pi}} \int_0^x e^{-x^2} dx$, $\frac{2}{\sqrt{\pi}} \int_0^x x^2 e^{-x^2} dx$, and $\frac{2}{\sqrt{\pi}} \int_0^x x^4 e^{-x^2} dx$ are constructed for the values of the argument x from 0.0 to 8.0, respectively.

1. Introduction

In this paper are given the numerical figures of functions $(2/\sqrt{\pi})\exp(-x^2)$, $(2/\sqrt{\pi})x^2\exp(-x^2)$, and $(2/\sqrt{\pi})x^4\exp(-x^2)$, which frequently appear in the theory of errors, and also in statistical mechanics and sometimes in stellar dynamics.

Most tables now existing (e. g., E. Jahnke u. F. Emde, 1928, and K. Hayashi, 1941) for the error function defined as the integral of the above first function, give practically insignificant figures for larger values of the argument; for instance, a certain seven decimal table of the error function gives a value, 0.9999998 for $x=4.0$. However, some problems, e. g., appearing in a certain field of stellar dynamics, need several significant figures after a series of 9's. In the present tables, a special attention is paid to keep the figures significant even for larger values of the argument.

2. Methods of Evaluation

We shall define the error function and the other similar functions as

$$\begin{aligned} \Phi_0(x) &= \frac{2}{\sqrt{\pi}} \int_0^x e^{-x^2} dx, & \Phi_0'(x) &= \frac{2}{\sqrt{\pi}} e^{-x^2}, \\ \Phi_2(x) &= \frac{2}{\sqrt{\pi}} \int_0^x x^2 e^{-x^2} dx, & \text{and} & & \Phi_4(x) &= \frac{2}{\sqrt{\pi}} \int_0^x x^4 e^{-x^2} dx. \end{aligned} \quad (1)$$

It is easily seen that

$$\Phi_2(x) = \frac{1}{2} \left\{ \Phi_0(x) - x\Phi_0'(x) \right\}, \quad \Phi_4(x) = \frac{3}{2} \left\{ \Phi_2(x) - \frac{1}{3} x^3 \Phi_0'(x) \right\}, \quad (2)$$

and that

$$\Phi_0(x) \rightarrow 1, \quad \Phi_2(x) \rightarrow \frac{1}{2}, \quad \text{and} \quad \Phi_4(x) \rightarrow \frac{3}{4}, \quad \text{for } x \rightarrow \infty, \quad (3)$$

respectively.

The functions $\Phi_0'(x)$, $\Phi_0(x)$, $\Phi_2(x)$, and $\Phi_4(x)$ are computed for the values of x ranging from 0.0 to 8.0. Methods of the numerical evaluation are:

(i) For $0.00 \leq x \leq 1.00$, $\Phi_4(x)$ is computed through the power series,

$$\Phi_4(x) = \frac{2x^5}{\sqrt{\pi}} \left[\frac{1}{5} - \frac{x^2}{1!7} + \frac{x^4}{2!9} - \frac{x^6}{3!11} + \frac{x^8}{4!13} - (\text{down to the term of } x^{16}) \right], \quad (4)$$

and the eqs. (2) are employed for the other two functions.

(ii) For $1.1 \leq x \leq 2.8$, the values of the error function, $\Phi_0(x)$, are taken from the Y. Watanabe's seven figure table (1943); and these of the other two functions are obtained also with the aid of the eqs. (2).

(iii) For $2.9 \leq x \leq 8.0$, the asymptotic expansion is employed for the error function:

$$\Phi_0(x) \sim 1 - \frac{e^{-x^2}}{x\sqrt{\pi}} \left[1 - \frac{1}{2x^2} + \frac{1 \cdot 3}{(2x^2)^2} - \frac{1 \cdot 3 \cdot 5}{(2x^2)^3} + \frac{1 \cdot 3 \cdot 5 \cdot 7}{(2x^2)^4} - \dots \right]. \quad (5)$$

Accuracy of this expansion is not very high for the smaller values of x , say from 2.9 to 3.1; and the resulted functional values will include errors about ± 5 in the unit of final decimal of the tabulated figures. However, the errors affect very little to the values of $\Phi_2(x)$ and $\Phi_4(x)$ obtained through the eqs. (2). For the larger values of x , the expansion (5) yields amply accurate results.

3. Construction and Use of the Tables

The Table 1 gives the six decimal figures of $\Phi_0'(x)$, $\Phi_0(x)$, $\Phi_2(x)$, and $\Phi_4(x)$, and their first differences for every 0.01 values of x ranging from 0.00 to 1.00. To interpolate these functions, it is enough only to take the differences down to the second into account for almost all over the range of x , except for the cases of $\Phi_2(x)$ and $\Phi_4(x)$; in which the third and fourth differences will be needed for $0.00 \leq x \leq 0.30$.

In the Table 2 are given the values of $1 - \Phi_0(x)$, $\frac{1}{2} - \Phi_2(x)$, $\frac{3}{4} - \Phi_4(x)$, and their logarithms, with the natural values of $\Phi_0'(x)$, for every 0.1 values of x from 0.8 to 8.0. The first differences of the logarithmic values of the former three functions are given. For these three, the interpolation should be made with respect to the logarithmic values, *not* to the natural ones, by employing the first *and* second differences.

The errors in the tabulated values do not exceed ± 2 in the unit of the final decimal, except for the values noted in (iii), Section 2.
